Electricity is caused by electrons, the tiny particles that "orbit" around the edges of atoms, from which everything is made. Each electron has a small negative charge. An atom normally has an equal number of electrons and protons (positively charged particles in its nucleus or center), so atoms have no overall electrical charge.

The three basic principles for this tutorial can be explained using electrons, or more specifically, the charge they create: Voltage is the difference in charge between two points. Current is the rate at which charge is flowing. Resistance is a material's tendency to resist the flow of charge (current).

Before beginning electrical work gather a basic set of tools designed for wiring. If you try to strip wires using a knife instead of a stripper, you probably will nick the copper and weaken the wire. Twisting wires together using a pair of household slip-joint pliers is difficult, and the loose connection might come apart.
