Case study. Our study took place in Koliwezi, a city of about 450,000 inhabitants and an important mining centre since the first half of the 20 th century, with large open-pit mines located to the west of the city (Figure 1).The study was initiated because of concern - voiced by local authorities, civil society and non-governmental organizations - about the health risks for people living in ...

### Sustainability of artisanal mining of cobalt in DR Congo

Release of mercury is the primary impact of informal gold production. This impact is valued to compare open-pit, small-scale, and artisanal gold mining. Impact per ounce results: <\$5 (open-pit), \$200-\$3200 (small-scale and artisanal). Leakage from formal to informal gold production may increase net environmental impact.

### Valuing environmental impacts of mercury emissions from ...

Open pit mining, where material is excavated from an open pit, is one of the most common forms of mining for strategic minerals. This type of mining is particularly damaging to the environment because strategic minerals are often only available in small concentrations, which increases the amount of ore needed to be mined.

### Environmental Risks of Mining

Two open-pit gold mines in Montana closed in 1998 but continue to cost the state's taxpayers millions of dollars in reclamation and water-treatment efforts. Cyanide used at these mines to leach gold from ore resulted in such high levels of pollution that people cannot use nearby water resources until they have been subjected to extensive and ...

### Effects of Gold Mining on the Environment | Sciencing

The impacts are often more pronounced for open-pit mines than for underground mines, which tend to produce less waste. Degradation of aquatic ecosystems and receiving water bodies, often involving substantial reductions in water quality, can be among the most severe potential impacts of metals extraction.

### Appendix 2: Environmental and Social Impacts of Mining

Analyses of a deep wall in an open pit mine in the Peruvian Andes are used to compare limit equilibrium methods (SLIDE) with distinct element methods (UDEC) when the stability is controlled by rock mass strength. The pit wall has an overall slope angle of 37º and a height of 600 metres with an inter-ramp angle of 45º.
