The deployed network management system (NMS) is a critical element in realizing ROI and is used to support the five major network management functional areas. In many cases, more than one system is needed to realize the overall NMS capability. The five functional areas of network management for MPLS are known by the acronym FCAPS: Fault.

MPLS Traffic Engineering MIB. The MPLS Traffic Engineering MIB enables Simple Network Management Protocol (SNMP) agent support in Cisco software for Multiprotocol Label Switching (MPLS) traffic engineering (TE) management, as implemented in the MPLS Traffic Engineering MIB (MPLS TE MIB). The SNMP agent code operating with the MPLS TE MIB enables a standardized, SNMP-based approach to be used in managing the MPLS TE features in Cisco software.

Mr. Morris has done a great job of taking network management concepts and burrowing down into the details of how it all actually works. He lifts the haze of confusion that often surrounds MIBs and their implementation in NMS applications, and then ties in one of the hot new network technologies, MPLS, so that one can see how network management actually works with this and other IP-based protocols.
